French Researchers Identify 'Improbably High Rate of Deaths' in Newborns Who Received New RSV Shot

Independent French researchers discovered significant increase in newborn deaths in France coinciding with the rollout of Pfizer's new respiratory syncytial virus shot for pregnant women.

By Michael Nevradakis, Ph.D.

Also a dog, since a lie. Subscribe to The Defender's Top News of the Day. **It's free.**

French researchers identified a similar safety signal in both newborns and infants after the rollout of Beyfortus, a recently approved monoclonal antibody treatment for respiratory syncytial virus (RSV).

The discovery comes as public health authorities ramp up warnings about the spread of respiratory viruses and [step up vaccine promotion efforts](#).

In interviews with The Defender, the researchers — French independent investigative journalist Jérôme Rigaud and Dr. Jean-Marc Sabatier, president of Research Medic — explained that [data from French National Institute of Statistics and Economic Studies](#) (INSEE) indicates an improbably high rate of deaths of babies between 2 and 6 days old in France during September and October 2024.

INSEE is the authority that compiles official birth and [death data](#) in France.

But the French researchers and other medical experts who spoke with The Defender said the increase in newborn deaths may have been connected to Pfizer's Beyfortus and newborns and that the administration of monoclonal antibodies to the pregnant mothers of expectant babies may [pose serious risks to the unborn baby](#).

Dr. Meryl Nass, an internist, biological warfare epidemiologist and member of the Maine Board of Medicine, told The Defender that the data Rigaud and Sabatier discovered "is deeply concerning about the mortality rates, contacting the findings [for her website](#).

According to the CDC, nearly all children under age 5 years, 2023," she said. "In France, babies receive injections of Beyfortus before leaving the maternity hospital. Therefore, the vaccine is responsible for the rise in the mortality rate of newborns in September 2024."

According to MedLarge, following the 23.4 million children under age 5 years, the annual risk of RSV hospitalization is well under 1%."

ORDER NOW

Excess deaths among newborns alarming, "disturbing"

Marion told The Defender, "There is an excess of deaths for the months of September and October. The excess deaths in October are very alarming. It is the first time we have observed such a consecutive increase."

According to Rigaud, the increase in newborn deaths coincides with the introduction of Beyfortus in France.

"There is a strong concurrence with the deployment of Beyfortus from July 2023," he said. "In France, babies receive injections of Beyfortus before leaving the maternity hospital. Therefore, the vaccine is responsible for the rise in the mortality rate of newborns in September 2024."

According to MedLarge, the data show "a 60% increase in deaths of babies between 2 and 6 days of life compared with what would be expected. It means that "the reference is observed by dividing the number of deaths by the total number of births in 2018 and 2019 to the month x 3.03 deaths between 2 and 6 days per 1,000 births."

Rigaud said: "An observed mortality rate was 6.07 deaths per 1,000 births, and in October, it was 7.05 deaths per 1,000 births. Marion said, "It is astonishing that this very significant increase should be found two months in a row. It may well be due to the injection of Beyfortus since July 15, 2023."

"Although of no scientific value, I have received testimonials from relatives and friends of young mothers who have suffered the loss of their newborn baby or

Rigaud explained that the CDC published a paper in 2021 on all U.S. RSV deaths in children under 5 years old. The CDC found that "the mortality rate in children under 5 years old. The CDC found that "the mortality rate in children under 5 years was there were only 34 deaths per year with RSV, and only 17 deaths per year in children under 6 months of age."

Rigaud said: "The CDC found that "the mortality rate in children under 5 years was there were only 34 deaths per year with RSV, and only 17 deaths per year in children under 6 months of age."

Monoclonal antibodies may exacerbate symptoms rather than prevent them

These revelations come at the White House announced on Dec. 14, 2023, that it would make 238,000 additional doses of Beyfortus available last month, in addition to 77,000 doses that were released in November 2023.

A study published in the New England Journal of Medicine (NEJM) on Dec. 20 found that monoclonal antibodies may [exacerbate symptoms rather than](#) associated lower respiratory tract infection and against any severe RSV associated lower respiratory tract infection in conditions that approximated real-world settings."

The study was funded by AstraZeneca and Sanofi.

According to Barouch, official data do not indicate that Beyfortus is effective. The data do, however, indicate a high prevalence of adverse reactions — including [fatal reactions](#) — to monoclonal antibodies, in comparison to a placebo from respiratory illness.

"The most frequently reported adverse events are upper respiratory tract infections, including bronchiolitis," she said.

Barouch added that data from the French National Authority for Health (HAS) do not "support a preventable impact of Beyfortus in terms of reduced hospital stay, mortality or intensive care units, and mortality."

"According to HAS, in the study, the absolute risk of RSV infection was reduced by 3.3% in the four months following injection, and the absolute risk of hospitalization was reduced by 1.2% in the first four months," she said.

Barouch said the trials were not randomized or controlled, whereas the French government recommends injection from the first days of life in the maternity ward.

According to Nature Portfolio, as of Dec. 24, 2023, there were 64 adverse events of special interest (AESI) in infants who received the shot, 14 of which occurred in 2 months and 2 years of age. One death, that of a baby 1 month old, was reported to AstraZeneca, which oversees compiling the worst bronchiolitis. And according to the Agitprop, there were 106 adverse events reported, including 57 bronchitis and respiratory disorders.

Barouch added that [severe premature babies and newborns](#) suffering from bronchopulmonary dysplasia that compared Beyfortus with monoclonal antibody previously used on high-risk babies, recorded six deaths — five due to bronchitis. Of the six babies that died, five had been treated with Beyfortus.

"Here, Prince bronchitis cases are not attributed to the treatment by the investigator, who is also the manufacturer of the products," Barouch said. "But this suggests that incremental [germs name for Beyfortus] could facilitate and exacerbate bronchitis in these severely premature babies, paving the way for a more severe form."

"Let's not forget that this whole bronchiolitis 'prevention' campaign is supposed to avoid overcrowding hospitals with babies suffering from the disease," Barouch said. "If this product doesn't significantly reduce hospital admissions, it's a failure."

According to HAS, "Monoclonal antibodies are capable of activating the very last foreign material to destroy them," but the treatments come with a "risk that the body might trigger a strong reaction to the antibodies."

Complications may be serious and can include "acute anaphylaxis or life-threatening allergic reactions," HAS said. "Finally, the antibodies can also [result in organ damage](#)." This phenomenon is one of the adverse effects of antibody.

In the interview with Barouch, McCullough said, "Antibody-dependent enhancements (ADE) have always been something we've been worried about with RSV vaccines and monoclonal antibodies. It's a phenomenon in which the virus neutralizes the virus. And then [a] hyperacts [it] of the antibodies to bind, and receptor. In a sense, the antibody can bring the virus into the cell."

McCullough told The Defender, the mechanism of action of Beyfortus is the development of natural immunity with repeated exposures to RSV during childhood. Beyfortus mutation ensures you can be exposed with no immunity."

Barouch cited a study in which "two of the 25 subjects in the intervention group died, and 10 of the 25 subjects in the intervention group died, and 10 of the 25 subjects in the intervention group died, and 10

I bet those shots are meant to kill just like the covid shots.

CastleConnell · 6 days ago

Why are docs giving these to infants? They have lost their minds and ethics. We need to lose faith in a pill for every ill mentality, and realize that a pill can make you very ill.

22 · 6 · Reply · Share ›

QuentonQuale → CastleConnell · 1 days ago

Probably as they did with the covid jabs, pharma or insurance companies offering $$ for doctors who offer up more shots. Making customers for life and starting very early.

7 · 0 · Reply · Share ›

CastleConnell → QuentonQuale · 7 days ago

So the average doctor will sacrifice a child for a fee

3 · 0 · Reply · Share ›

Stuff Happens → CastleConnell · 7 days ago

Some won't. Some will. It's up to us to decide if the doc is a sellout or not. Don't be intimidated to tell doctors to pound salt if necessary.

1 · 0 · Reply · Share ›

Stuff Happens → CastleConnell · 7 days ago

Parents give psychotropics to 5 yr olds. The amount of faith people put into prescription medications to solve non-existing problems is completely out of hand. My boss said she took her pre-teen to summer camp and the amount of prescription meds for the children were lined up across the camp counselor's long shelf. Are you kidding me? Stop. Just stop.

4 · 0 · Reply · Share ›

Allen → CastleConnell · 6 days ago

Can't lose what you never had. Doctors are not very bright- just indoctrinated. Most are sociopathic- never had ethics to begin with.

As for the Why? Check this out:

Data reported to the CDC indicated that 14% of pregnant women in Pfizer's trial sustained an adverse event, with 4.2% sustaining a "serious" adverse event, 1.7% experiencing a "severe" adverse event and 0.5% suffering a "life-threatening" adverse event. Nevertheless, it is expected that Pfizer's product will receive FDA approval this Fall.

Similarly, the same data showed that 37.1% of infants whose mothers received the experimental Pfizer vaccine experienced adverse events within one month of birth — with 15.5% classified as "serious," 4.5% as "severe" and 1% as "life-threatening."

Despite the numerous violations, scandals and long-standing track records of dangerous products produced by the companies involved, the RSV vaccine gold rush continues at full speed.

Truthie · 6 days ago

Vile and disgusting murderers. Nothing else to say about those who are jabbing newborn babies.

9 · 0 · Reply · Share ›

BChristine · 6 days ago · edited

Infants ***do not need*** this RSV vaccine - just like the majority (if not all) the other ones they are attacked with at such a tender age. There should be a "vaccine" to protect them from injury, harm and death from all the Big Pharma's toxic vaccines ... just sayin'.

Jennifo · 7 days ago

I just saw a commercial last night showing a pregnant mom get the RSV shot to 'protect' her baby at birth. Good Lord above! I wasn't advised to eat mushrooms on my food while pregnant! We've lost our damn minds.

I would be petrified if I was pregnant these days. I'd be looking for a midwife for a home delivery. I hope midwivery starts popping up all over the world & women move to have their babies more naturally without hospitals. My last delivery with a midwife (MD but also in a hospital setting). She allowed me to control most of what happened during delivery (temperature, lights, no word of an epidural or drugs, 2 people in the room, no chaos). It was wonderful.

jann · 7 days ago

So Beyfortus is being called a "treatment" and not a "vaccine." I guess that as people catch on to the truth about vaccines, "treatment" will be a more acceptable term. I wonder if parents are given informed consent, if there is a package insert, known reactions including: swelling of the face, mouth, or tongue
difficulty swallowing or breathing
unresponsiveness
bluish color of skin, lips, or under fingernails
muscle weakness
severe rash, hives, or itching,
or just the most common reactions of: rash and pain, swelling, or hardness at the site of your child's injection. https://www.beyfortus.com/#...

Another New Zealand data scandal - HPV.
This is the second 'revelation' about data and the New Zealand health authorities this month. There are clearly a number of issues with this one that are very apparent. These are the vaccines that are given to young teenagers and some parents report significant changes in their children afterwards.

Retracted NZ Study Proved HPV Vaccine 'Reduced Preterm Births' - By INVERTING THE DATA
Study Initiator Concealed Payments by HPV Vaccine Rights Owner

4 · 0 · Reply · Share ›

LS · 7 days ago

These pharmaceutical companies already know their drug will be taken off the market in time. They know they will be sued. But like so many times before, it doesn't stop them because they stand to make so much money above and beyond the fall out. How many times have they tried giving babies RSV shots that "failed"? Stay away from hospitals. All these people, Pharma execs, docs, administrators, nurses will end up in hell right next to all the other mass murders throughout history. Idiots!!! their time on this earth is nothing compared to the length of eternity they will spend in hell suffering every minute of every day and every minute of every night. Their day is coming sooner than they realize.

Beyfortus is a monoclonal antibody and Inactive ingredients: L-histidine, L-histidine hydrochloride, L-arginine hydrochloride, sucrose, polysorbate 80, water for injections.

Polysorbate 80 goes into the brain. Those vaccines with it may kill people. They should not allow this ingredient.

Why sugar in the shot? Sugar may lower the immune system.

3 · 0 · Reply · Share ›

nick quinlan · 6 days ago

I've said this before, the US vaccine program is organized crime masquerading as health care.
The entire vaccine industry must be shut down permanently. It is a cesspool of corruption, and no child has EVER needed any shots to be healthy.
No vaccine has ever been proven to protect anyone from anything, but there are mountains of evidence of their failure, and the untold thousands of deaths and injuries to previously healthy babies and children.
So many people in this industry belong in prison for the rest of their lives.

1 · 0 · Reply · Share ›

Shane · 7 days ago

Babies and pregnant mother should not get any vaccines as the baby has an underdeveloped immune system.

4 · 0 · Reply · Share ›

GrouchyMathGrad · 5 days ago

This vaccine/treatment kills one out of 3,000 babies within a few days. Lord only knows what it does to their health or mortality down the line. And it's pretty clear on a fairly close examination that any benefits were from "massaging" the studies.

Will this treatment get pulled, or has the rot gone so deep that proof is not enough?
